# **Hoop Analytics 101**

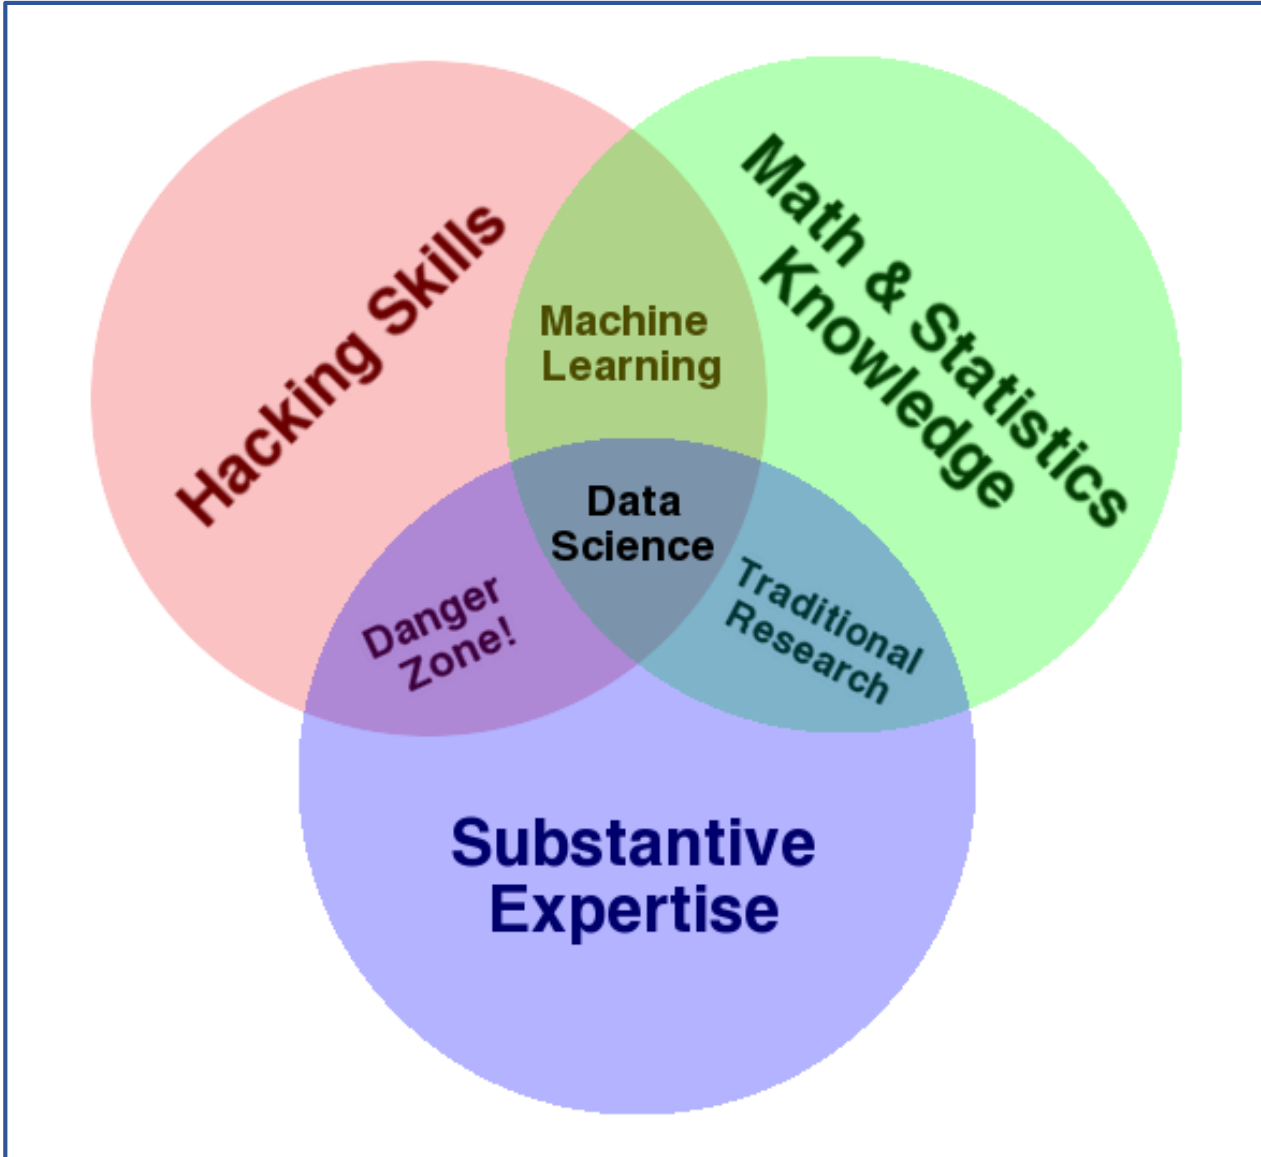

## An Introduction to Basketball Analytics

(the opportunity is there!)

“We can’t get data into the thing.”

The Data Scientist is going to be the person that **understands the client needs**, and then how to position those needs as **a question that can be answered with data** found in the database.

The Data Scientist **must be good** at **statistics** and **data analytics**, **computer science** and **database** work

How did I get in the  
sports analytics)?

Ans. Kobe Bryar

# Game Plan

- Foundations of Analytics – Preparing Data for Analysis
- The History of Basketball Analytics
  - The Bill James (Analytics) Revolution
  - Considering interpretations of metrics
- Modeling Basketball Data
- Evaluate and find players using what was learned modeling the data
- Bracketology and the Midway Mules
- Discussion

# Preparing Data for Analysis

---

- <https://www.basketball-reference.com/>
- Create the dataset(s)
- TeamGo, TeamStop, MiscStats, TeamPossStats
- Exploratory Data Analysis (EDA)
  - Data cleansing (Timberwolve vs. Timberwolves)
  - Look for outliers, missing values, etc.

# History of Basketball Analytics

---

- Who and what?
- Bill James
- Pythagorean Theorem for Basketball
- Explore Basketball Metrics like Field Goal Percentage, True Shooting Percentage, and the Effective Field Goal Percentage

# The History of Basketball Analytics

1950-60s

**Coach Frank McGuire** uses possession statistics. **Dean Smith** continued to use McGuire's approaches

1970s

**Bill James** demonstrates the value of analytics in baseball: Baseball Abstracts and Pythag Thm for Baseball gain popularity

1970-80s

More coaches think analytically: **Hubie Brown, Jack Ramsey, Tom Davis.** Charts used for "in game" decisioning

1990s

"Moneyball" supports use of analytics. **Oliver** (Four Factors) **Hollinger** (PER), **Pomroy** surface as leaders

2000s

Data sources, statistical methods and computational tools (**SAS, R, Python**, etc.) make analysis main stream

# THE BILL JAMES (ANALYTICS) REVOLUTION

## Bill James

- Runs Created
- Range Factor
- Baseball's Pythagorean Theorem

First published in 1977

**“What James demands is that we take the time to listen to what the game is telling us over and above what we are predisposed to believe”**

## The 2006 TIME 100 >

Here's our list of the 100 men and women whose power, talent or moral example is transforming our world

### SCIENTISTS & THINKERS

## Bill James

By John Henry | Monday, May 08, 2006

92 of 102  
[VIEW ALL](#)

The Red Sox raised a few eyebrows by hiring maverick statistician Bill James in 2002. That was before the team won its first World Series in 86 years. When I asked our general manager, Theo Epstein, what he thought about James' impact on the game, he said, "The thing that stands out for me is Bill's humility. He was an outsider, self-publishing invisible truths about baseball while the Establishment ignored him. Now 25 years later, his ideas have become part of the foundation of baseball strategy. But where's Bill? Where's the gloating? Where's the publicist? He's like somebody outlining the Internet in the '80s and watching silently as it comes to pass."

Keith Philpott for TIME

What we now know as Moneyball and sabermetrics came from James, 56. He taught us, among other things, that individual ballparks have a profound effect on a ballplayer's production, that the largest variable determining how many runs a team will score is how many times the leadoff hitter gets on base, that much of what we perceive as pitching is actually defense. What I call Jamesian principles infuse our thinking with a perspective that is objective rather than subjective. What James demands is that we take the time to listen to what the game is telling us over and above what we are predisposed to believe.

# Sabermetrics

Society for American  
Baseball Research

“The mathematical and  
statistical analysis of baseball”

# APBRmetrics

Association for Professional  
Basketball Research

“Analyzing basketball statistics  
through objective evidence”

## The Pythagorean Theorem of Baseball

$$\textit{Winning Percentage} = \frac{W}{(W + L)} \cong \frac{R^2}{(R^2 + RA^2)}$$

## Actual Winning Percentage (WP) vs the Pythagorean Estimate (estWP) for Winning Percentage

“People who run ball clubs, they think in terms of buying players. Your goal shouldn’t be to buy players; your goal should be to buy wins. And in order to buy wins, you need to buy runs ...”

--- Peter Brand

## Batting Average (BA)

$$BA = \frac{H}{AB}$$

## On Base Percentage (OBP)

$$OBP = \frac{(H + BB + HBP)}{(AB + BB + HBP + SF)}$$

**Will these ideas apply  
to the game of basketball?**

# Modeling Basketball Data

---

- Testing ideas – consider that if want to build a team ... we want to know how to evaluate players
- Dean Oliver's Four Factors
- Predicting Winning Percentages using Statistical Models

# Evaluating Basketball Talent

---

- Considering what we've learned from the modeling effort, can we find players that meet our goals?

# Bracketology

---

- The Midway Mules were great in the “long haul” of tournaments
- It’s not about picking which team will win “a single game,” but the challenge is to find which teams are best equipped to win 6 tournament games

# **How do basketball teams win games?**

<https://www.basketball-reference.com/about/factors.html>

# Thank You!
